

COMP9020 Lecture 4-5

Session 1, 2018

Functions and Relations

- Textbook (R & W) - Ch. 1&3, Sec. 1.7, 3.1, 3.3–3.4;
Ch. 11, Sec. 11.1–11.2
- Problem sets 4 and 5
- Supplementary Exercises Ch. 3 and 11 (R & W)

NB

Mid-session test: Friday, 13 April, 1–2pm (45 mins)

- [Instructions & Prac Exams](#) on course webpage (→ Exams)
- Fun Quiz in today's lecture

Quiz Rules

Quiz 2 due Thu, 29 Mar

Please ...

- use your own best judgement to understand & solve questions
- email me if you think Moodle is wrong (question or answer)
- discuss quizzes on the forum only **after** the deadline

Do not ...

- post specific questions about the quiz **before** the deadline
- ask me to check your answers before you submit
- agonise too much about a question that you find too difficult

NB

- 1 Quizzes are for you to demonstrate your ability to understand and solve problems (like an exam)
- 2 They give you feedback on how well you have understood the contents (to prepare you for the exam)

Properties of Functions

Recall:

$$f : S \longrightarrow T$$

S — **domain** of f , symbol: $\text{Dom}(f)$

T — **codomain** of f , symbol: $\text{Codom}(f)$

$\{f(x) : x \in \text{Dom}(f)\}$ — **image** of f , symbol: $\text{Im}(f)$

$g \circ f : x \mapsto g(f(x))$, requiring $\text{Im}(f) \subseteq \text{Dom}(g)$

Function is called **onto** (or **surjective**) if every element of the codomain is mapped to by at least one x in the domain, i.e.

$$\text{Im}(f) = T$$

Examples (of functions that are not onto)

- $f : \mathbb{N} \longrightarrow \mathbb{N}$ with $f(x) \mapsto x^2$
- $f : \{a, \dots, z\}^* \longrightarrow \{a, \dots, z\}^*$ with $f(w) \mapsto awe$

1-1 Functions

Function is called **1–1** (**one-to-one**) or **injective** if different x implies different $f(x)$, i.e.

$$f(x) = f(y) \Rightarrow x = y$$

Examples (of functions that are not 1–1)

- absolute value
- floor, ceiling
- length of a word

Inverse Functions

Definition

Inverse function for a given $f : S \rightarrow T$

$$f^{-1} : T \rightarrow S \quad \text{s.t. } f^{-1}(f(x)) = x \text{ for all } x \in S$$

exists exactly when f is both 1-1 and onto

Image of a subdomain A under a function

$$f(A) = \{ f(s) : s \in A \} = \{ t \in T : t = f(s) \text{ for some } s \in A \}$$

Inverse image — $f^{\leftarrow}(B) = \{ s \in S : f(s) \in B \} \subseteq S$;
it is defined for every f

If f^{-1} exists then $f^{\leftarrow}(B) = f^{-1}(B)$

$$f(\emptyset) = \emptyset, f^{\leftarrow}(\emptyset) = \emptyset$$

满射, 1-1
onto, into, 1-1?

Examples

1.7.5 f and g are 'shift' functions $\mathbb{N} \rightarrow \mathbb{N}$ defined by
 $f(n) = n + 1$, and $g(n) = \max(0, n - 1)$

- (c) Is f 1-1? onto?
- (d) Is g 1-1? onto?
- (e) Do f and g commute, i.e. $\forall n ((f \circ g)(n) = (g \circ f)(n))$?

5

6

Examples

1.7.5 f and g are 'shift' functions $\mathbb{N} \rightarrow \mathbb{N}$ defined by
 $f(n) = n + 1$, and $g(n) = \max(0, n - 1)$

(c) f is 1-1, not onto: $f(\mathbb{N}) = \mathbb{N} \setminus \{0\} = \mathbb{P}$

(d) g is onto, not 1-1: $g(0) = g(1)$

(e) f and g do not commute:

$$g \circ f : n \mapsto (n + 1) - 1 = n, \text{ thus } g \circ f = \text{Id}_{\mathbb{N}}$$

$$f \circ g : 0 \mapsto 1, \text{ hence } f \circ g \neq \text{Id}_{\mathbb{N}}$$

NB

$f \circ g$ is the identity when restricted to \mathbb{P}

NB

For a **finite** set S and $f : S \rightarrow S$ the properties

- ① onto, and
- ② 1-1

are equivalent. (Proof suggestion?)

7

8

Examples

1.7.6 $\Sigma = \{a, b, c\}$

(c) Is $\text{length} : \Sigma^* \rightarrow \mathbb{N}$ onto?

(d) $\text{length}^{\leftarrow}(2) = ?$

Examples

1.7.12 Verify that $f : \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R} \times \mathbb{R}$ defined by $f(x, y) = (x + y, x - y)$ is invertible.

Examples

1.7.6 $\Sigma = \{a, b, c\}$

(c) Is $\text{length} : \Sigma^* \rightarrow \mathbb{N}$ onto? Yes: $\text{length}^{\leftarrow}(\{n\}) = \Sigma^n \neq \emptyset$

(d) $\text{length}^{\leftarrow}(2) = \{aa, ab, ac, bb, \dots, cc\}$

Examples

1.7.12 Verify that $f : \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R} \times \mathbb{R}$ defined by $f(x, y) = (x + y, x - y)$ is invertible.

The inverse is $f^{-1}(a, b) = (\frac{a+b}{2}, \frac{a-b}{2})$; substituting shows that $f \circ f^{-1} = \text{Id}_{\mathbb{R} \times \mathbb{R}}$

Supplementary Exercises [cont'd]

Examples

1.7.6 $\Sigma = \{a, b, c\}$

(c) Is $\text{length} : \Sigma^* \rightarrow \mathbb{N}$ onto? Yes: $\text{length}^{\leftarrow}(\{n\}) = \Sigma^n \neq \emptyset$

(d) $\text{length}^{\leftarrow}(2) = \{aa, ab, ac, bb, \dots, cc\}$

Examples

1.7.12 Verify that $f : \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R} \times \mathbb{R}$ defined by $f(x, y) = (x + y, x - y)$ is invertible.

The inverse is $f^{-1}(a, b) = (\frac{a+b}{2}, \frac{a-b}{2})$; substituting shows that $f \circ f^{-1} = \text{Id}_{\mathbb{R} \times \mathbb{R}}$

1.8.16 $\Sigma = \{a, b\}$; relate it to Σ^*

(a) Is there an onto $\Sigma \rightarrow \Sigma^*$?

(b) Is there an onto $\Sigma^* \rightarrow \Sigma$?

Supplementary Exercises [cont'd]

1.8.16 $\Sigma = \{a, b\}$; relate it to Σ^*

(a) Is there an onto $\Sigma \rightarrow \Sigma^*$? No: $|\Sigma| = 2, |\Sigma^*| = \infty$.

(b) Is there an onto $\Sigma^* \rightarrow \Sigma$? Yes, eg $f(\omega) = a$ when $\text{length}(\omega)$ is odd, $f(\omega) = b$ when $\text{length}(\omega)$ is even.

The following is **not** completely correct $f : \omega \mapsto \langle \text{first letter of } \omega \rangle$

Reason: $f(\lambda)$ is not defined.

Matrices

An $m \times n$ **matrix** is a rectangular array with m horizontal rows and n vertical columns.

$$\mathbf{A} = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix}$$

NB

Matrices are important objects in Computer Science, e.g. for

- optimisation
- graphics and computer vision
- cryptography
- information retrieval and web search
- machine learning

13

14

Basic Matrix Operations

The **transpose** \mathbf{A}^T of an $m \times n$ matrix $\mathbf{A} = [a_{ij}]$ is the $n \times m$ matrix whose entry in the i th row and j th column is a_{ji} .

Example

$$\mathbf{A} = \begin{bmatrix} 2 & -1 & 0 & 4 \\ 3 & 2 & -1 & 2 \\ 4 & 0 & 1 & 3 \end{bmatrix} \quad \mathbf{A}^T = \begin{bmatrix} 2 & 3 & 4 \\ -1 & 2 & 0 \\ 0 & -1 & 1 \\ 4 & 2 & 3 \end{bmatrix}$$

NB

A matrix \mathbf{M} is called **symmetric** if $\mathbf{M}^T = \mathbf{M}$

The **sum** of two $m \times n$ matrices $\mathbf{A} = [a_{ij}]$ and $\mathbf{B} = [b_{ij}]$ is the $m \times n$ matrix whose entry in the i th row and j th column is $a_{ij} + b_{ij}$.

Example

$$\mathbf{A} = \begin{bmatrix} 2 & -1 & 0 & 4 \\ 3 & 2 & -1 & 2 \\ 4 & 0 & 1 & 3 \end{bmatrix} \quad \mathbf{B} = \begin{bmatrix} 1 & 0 & 5 & 3 \\ 2 & 3 & -2 & 1 \\ 4 & -2 & 0 & 2 \end{bmatrix}$$
$$\mathbf{A} + \mathbf{B} = \begin{bmatrix} 3 & -1 & 5 & 7 \\ 5 & 5 & -3 & 3 \\ 8 & -2 & 1 & 5 \end{bmatrix}$$

Fact

$\mathbf{A} + \mathbf{B} = \mathbf{B} + \mathbf{A}$ and $(\mathbf{A} + \mathbf{B}) + \mathbf{C} = \mathbf{A} + (\mathbf{B} + \mathbf{C})$

15

16

Given $m \times n$ matrix $\mathbf{A} = [a_{ij}]$ and $c \in \mathbb{R}$, the **scalar product** $c\mathbf{A}$ is the $m \times n$ matrix whose entry in the i th row and j th column is $c \cdot a_{ij}$.

Example

$$\mathbf{A} = \begin{bmatrix} 2 & -1 & 0 & 4 \\ 3 & 2 & -1 & 2 \\ 4 & 0 & 1 & 3 \end{bmatrix} \quad 2\mathbf{A} = \begin{bmatrix} 4 & -2 & 0 & 8 \\ 6 & 4 & -2 & 4 \\ 8 & 0 & 2 & 6 \end{bmatrix}$$

The **product** of an $m \times n$ matrix $\mathbf{A} = [a_{ij}]$ and an $n \times p$ matrix $\mathbf{B} = [b_{jk}]$ is the $m \times p$ matrix $\mathbf{C} = [c_{ik}]$ defined by

$$c_{ik} = \sum_{j=1}^n a_{ij}b_{jk} \quad \text{for } 1 \leq i \leq m \text{ and } 1 \leq k \leq p$$

Example

$$\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \cdot \begin{bmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{bmatrix} = \begin{bmatrix} a_{11}b_{11} + a_{12}b_{21} & a_{11}b_{12} + a_{12}b_{22} \\ a_{21}b_{11} + a_{22}b_{21} & a_{21}b_{12} + a_{22}b_{22} \end{bmatrix}$$

NB

The **rows** of \mathbf{A} must have the same number of entries as the **columns** of \mathbf{B} .

The product of a $1 \times n$ matrix and an $n \times 1$ matrix is usually called the **inner product** of two **n-dimensional vectors**.

Example

Consider

$$\mathbf{A} = \begin{bmatrix} 1 & 2 \\ 2 & 4 \end{bmatrix} \quad \mathbf{B} = \begin{bmatrix} 2 & -1 \\ -6 & 3 \end{bmatrix}$$

Calculate \mathbf{AB} , \mathbf{BA}

$$\mathbf{AB} = \begin{bmatrix} -10 & 5 \\ -20 & 10 \end{bmatrix} \quad \mathbf{BA} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

NB

In general, $\mathbf{A} \cdot \mathbf{B} \neq \mathbf{B} \cdot \mathbf{A}$

Example

Consider

$$\mathbf{A} = \begin{bmatrix} 1 & 2 \\ 2 & 4 \end{bmatrix} \quad \mathbf{B} = \begin{bmatrix} 2 & -1 \\ -6 & 3 \end{bmatrix}$$

Calculate \mathbf{AB} , \mathbf{BA}

$$\mathbf{AB} = \begin{bmatrix} -10 & 5 \\ -20 & 10 \end{bmatrix} \quad \mathbf{BA} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

NB

In general, $\mathbf{A} \cdot \mathbf{B} \neq \mathbf{B} \cdot \mathbf{A}$

Example: Computer Graphics

Rotating an object w.r.t. the x axis by degree α :

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \alpha & -\sin \alpha \\ 0 & \sin \alpha & \cos \alpha \end{bmatrix} \cdot \begin{bmatrix} 5 & 5 & 7 & 7 & 5 & 7 & 5 & 7 \\ 1 & 1 & 1 & 1 & 3 & 3 & 3 & 3 \\ 9 & 7 & 7 & 9 & 7 & 7 & 9 & 9 \end{bmatrix}$$

Relations and their Representation

Relations are an abstraction used to capture the idea that the objects from certain domains (often the same domain for several objects) are *related*. These objects may

- influence one another (each other for binary relations; self(?) for unary)
- share some common properties
- correspond to each other precisely when some constraints are satisfied

In general, relations formalise the concept of interaction among objects from various domains; however, there must be a specified domain for each type of objects.

21

22

Database Examples

An **n-ary relation** is a subset of the cartesian product of n sets.

$$\mathcal{R} \subseteq S_1 \times S_2 \times \dots \times S_n$$

$$x \in \mathcal{R} \Rightarrow x = (x_1, x_2, \dots, x_n) \text{ where each } x_i \in S_i$$

If $n = 2$ we have a **binary** relation $\mathcal{R} \subseteq S \times T$.

(mostly we consider binary relations)

equivalent notations: $(x_1, x_2, \dots, x_n) \in \mathcal{R} \iff \mathcal{R}(x_1, x_2, \dots, x_n)$

for binary relations: $(x, y) \in \mathcal{R} \iff \mathcal{R}(x, y) \iff x\mathcal{R}y$.

Example (course enrolments)

S = set of CSE students

(S can be a subset of the set of all students)

C = set of CSE courses

(likewise)

E = enrolments = $\{ (s, c) : s \text{ takes } c \}$

$$E \subseteq S \times C$$

In practice, almost always there are various 'onto' (nonemptiness) and 1-1 (uniqueness) constraints on database relations.

23

24

Example (class schedule)

C = CSE courses
 T = starting time (hour & day)
 R = lecture rooms
 S = schedule =

$$\{ (c, t, r) : c \text{ is at } t \text{ in } r \} \subseteq C \times T \times R$$

Example (sport stats)

$$\mathcal{R} \subseteq \text{competitions} \times \text{results} \times \text{years} \times \text{athletes}$$

Relations are ubiquitous in Computer Science

- Databases are collections of relations
- Common data structures (e.g. graphs) are relations
- Any ordering is a relation
- Functions/procedures/programs compute relations between their input and output

Relations are therefore used in most problem specifications and to describe formal properties of programs.

For this reason, studying relations and their properties helps with formalisation, implementation and verification of programs.

n -ary Relations

Relations can be defined linking $k \geq 1$ domains D_1, \dots, D_k simultaneously.

In database situations one also allows for *unary* ($n = 1$) relations.

Most common are **binary** relations

$$\mathcal{R} \subseteq S \times T; \quad \mathcal{R} = \{(s, t) \mid \text{"some property that links } s, t"\}$$

For related s, t we can write $(s, t) \in \mathcal{R}$ or $s\mathcal{R}t$; for unrelated items either $(s, t) \notin \mathcal{R}$ or $s \not\mathcal{R}t$.

\mathcal{R} can be defined by

- explicit enumeration of interrelated k -tuples (ordered pairs in case of binary relations);
- properties that identify relevant tuples within the entire $D_1 \times D_2 \times \dots \times D_k$;
- construction from other relations.

Functions as Relations

Any function $f : S \rightarrow T$ can be viewed as a binary relation

$$\{ (s, f(s)) : s \in S \} \subseteq S \times T$$

If a subset of $S \times T$ corresponds to a function, it must satisfy certain conditions w.r.t. S and T (which?)

Binary Relations

A binary relation, say $\mathcal{R} \subseteq S \times T$, can be presented as a matrix with rows enumerated by (the elements of) S and the columns by T ; eg. for $S = \{s_1, s_2, s_3\}$ and $T = \{t_1, t_2, t_3, t_4\}$ we may have

$$\begin{bmatrix} \bullet & \circ & \bullet & \bullet \\ \circ & \bullet & \bullet & \bullet \\ \bullet & \bullet & \circ & \circ \end{bmatrix}$$

Example

3.1.2(e) Write the following relation on $A = \{0, 1, 2\}$ as a matrix.

$(m, n) \in \mathcal{R}$ if $m \cdot n = m$

$$\begin{matrix} & 0 & 1 & 2 \\ \begin{matrix} 0 \\ 1 \\ 2 \end{matrix} & \begin{bmatrix} \bullet & \bullet & \bullet \\ \circ & \bullet & \circ \\ \circ & \bullet & \circ \end{bmatrix} \end{matrix}$$

29

Navigation icons

30

Navigation icons

Example

Relations on a Single Domain

3.1.2(e) Write the following relation on $A = \{0, 1, 2\}$ as a matrix.

$(m, n) \in \mathcal{R}$ if $m \cdot n = m$

$$\begin{matrix} & 0 & 1 & 2 \\ \begin{matrix} 0 \\ 1 \\ 2 \end{matrix} & \begin{bmatrix} \bullet & \bullet & \bullet \\ \circ & \bullet & \circ \\ \circ & \bullet & \circ \end{bmatrix} \end{matrix}$$

Particularly important are binary relationships between the elements of the same set. We say that ' \mathcal{R} is a binary relation on S ' if

$$\mathcal{R} \subseteq S \times S$$

31

Navigation icons

32

Navigation icons

Special (Trivial) Relations

(all w.r.t. set S)

Identity (diagonal, equality) $E = \{ (x, x) : x \in S \}$

Empty \emptyset

Universal $U = S \times S$

Important Properties of Binary Relations $\mathcal{R} \subseteq S \times S$

- (R) reflexive $(x, x) \in \mathcal{R} \quad \forall x \in S$
- (AR) antireflexive $(x, x) \notin \mathcal{R} \quad \forall x \in S$
- (S) symmetric $(x, y) \in \mathcal{R} \Rightarrow (y, x) \in \mathcal{R} \quad \forall x, y \in S$
- (AS) antisymmetric $(x, y), (y, x) \in \mathcal{R} \Rightarrow x = y \quad \forall x, y \in S$
- (T) transitive $(x, y), (y, z) \in \mathcal{R} \Rightarrow (x, z) \in \mathcal{R} \quad \forall x, y, z \in S$

NB

An object, notion etc. is considered to satisfy a property if none of its instances violates any defining statement of that property.

33

Navigation icons

34

Navigation icons

Examples

- (R) reflexive $(x, x) \in \mathcal{R} \text{ for all } x \in S \quad \begin{bmatrix} \bullet & \bullet & \bullet \\ \circ & \bullet & \bullet \\ \circ & \circ & \bullet \end{bmatrix}$
- (AR) antireflexive $(x, x) \notin \mathcal{R} \quad \begin{bmatrix} \circ & \bullet & \bullet \\ \bullet & \circ & \bullet \\ \bullet & \bullet & \circ \end{bmatrix}$
- (S) symmetric $(x, y) \in \mathcal{R} \Rightarrow (y, x) \in \mathcal{R} \quad \begin{bmatrix} \bullet & \circ & \bullet \\ \circ & \bullet & \bullet \\ \bullet & \bullet & \circ \end{bmatrix}$
- (AS) antisymmetric $(x, y), (y, x) \in \mathcal{R} \Rightarrow x = y \quad \begin{bmatrix} \bullet & \bullet & \circ \\ \circ & \circ & \bullet \\ \bullet & \bullet & \circ \end{bmatrix}$
- (T) transitive $(x, y), (y, z) \in \mathcal{R} \Rightarrow (x, z) \in \mathcal{R} \quad \begin{bmatrix} \circ & \bullet & \bullet \\ \bullet & \circ & \bullet \\ \circ & \circ & \circ \end{bmatrix}$

Example

3.1.1 The following relations are on $S = \{1, 2, 3\}$.

Which of the properties (R), (AR), (S), (AS), (T) does each satisfy?

(a) $(m, n) \in \mathcal{R}$ if $m + n = 3$

(AR) and (S)

(e) $(m, n) \in \mathcal{R}$ if $\max\{m, n\} = 3$

(S)

3.1.2(b) $(m, n) \in \mathcal{R}$ if $m < n$

(AR), (AS), (T)

35

Navigation icons

36

Navigation icons

Example

3.1.1 The following relations are on $S = \{1, 2, 3\}$.

Which of the properties (R), (AR), (S), (AS), (T) does each satisfy?

(a) $(m, n) \in \mathcal{R}$ if $m + n = 3$
(AR) and (S)

(e) $(m, n) \in \mathcal{R}$ if $\max\{m, n\} = 3$
(S)

3.1.2(b) $(m, n) \in \mathcal{R}$ if $m < n$
(AR), (AS), (T)

Interaction of Properties

A relation *can* be both symmetric and antisymmetric. Namely, when \mathcal{R} consists only of some pairs (x, x) , $x \in S$.

A relation *cannot* be simultaneously reflexive and antireflexive (unless $S = \emptyset$).

NB

$\left. \begin{array}{l} \text{nonreflexive} \\ \text{nonsymmetric} \end{array} \right\}$ is not the same as $\left\{ \begin{array}{l} \text{antireflexive/irreflexive} \\ \text{antisymmetric} \end{array} \right.$

37

38

Relation \mathcal{R} as Correspondence From S to T

Most important kinds of relations on S

- total order $\begin{bmatrix} \bullet & \bullet & \bullet \\ \circ & \circ & \circ \\ \circ & \circ & \bullet \end{bmatrix}$
- partial order $\begin{bmatrix} \bullet & \bullet & \bullet \\ \circ & \circ & \bullet \\ \circ & \circ & \bullet \end{bmatrix}, \begin{bmatrix} \bullet & \bullet & \circ \\ \circ & \circ & \bullet \\ \circ & \circ & \bullet \end{bmatrix}$
- equivalence $\begin{bmatrix} \bullet & \bullet & \circ \\ \circ & \circ & \bullet \\ \circ & \circ & \bullet \end{bmatrix}$
- identity $\begin{bmatrix} \bullet & \circ & \circ \\ \circ & \bullet & \circ \\ \circ & \circ & \bullet \end{bmatrix}$

NB

Some of those are special cases of the others, eg. 'total order' of a 'partial order', 'identity' of an 'equivalence'.

$\mathcal{R}(A) \stackrel{\text{def}}{=} \{t \in T \mid (s, t) \in \mathcal{R} \text{ for some } s \in A \subseteq S\}$

$\mathcal{R}^{\leftarrow}(B) \stackrel{\text{def}}{=} \{s \in S \mid (s, t) \in \mathcal{R} \text{ for some } t \in B \subseteq T\}$

Converse relation \mathcal{R}^{\leftarrow}

$$\mathcal{R}^{\leftarrow} = \{(t, s) \in T \times S \mid (s, t) \in \mathcal{R}\}$$

Note that $\mathcal{R}^{\leftarrow} \subseteq T \times S$.

Observe that $(\mathcal{R}^{\leftarrow})^{\leftarrow} = \mathcal{R}$.

39

40

NB

Viewed this way \mathcal{R} becomes a function from $\text{Pow}(S)$ to $\text{Pow}(T)$. However, not every $g : \text{Pow}(S) \rightarrow \text{Pow}(T)$ can be matched to a relation.

(Why? Using a small domain like $S = \{a, b\}$, provide an example of a function $g : \text{Pow}(S) \rightarrow \text{Pow}(T)$ which does not correspond to any relation on S ! Can you even do it with $S' = \{a\}$?)

NB

The order of axes — S and T — is important. For $\mathcal{R} \subseteq S \times S$, its converse \mathcal{R}^{\leftarrow} is usually quite different from \mathcal{R} .

Example: divisibility relation on \mathbb{P}

$$\begin{aligned} D &\stackrel{\text{def}}{=} \{ (p, q) : p \mid q \} = \{(1, 1), (1, 2), \dots, (2, 2), (2, 4), \dots\} \\ D^{\leftarrow} &= \{ (p, q) : p \in q\mathbb{P} \} \\ &= \{(1, 1), (2, 1), (2, 2), (3, 1), (3, 3), (4, 1), (4, 2), \dots\} \end{aligned}$$

For every $n \in \mathbb{P}$, $D(\{n\})$ is infinite, $D^{\leftarrow}(\{n\})$ is finite.

41

42

Example

Question

f^{\leftarrow} is a relation; when is it a function?

Answer

When f is 1-1 and onto.

Question

f^{\leftarrow} is a relation; when is it a function?

3.1.9 Find the properties of the *empty relation* $\emptyset \subset S \times S$ and the *universal relation* $U = S \times S$. Assume that S is a nonempty domain.

- (a) \emptyset is (AR), (S), (AS), (T); if $S = \emptyset$ itself then \emptyset is also (R).
- (b) U is (R), (S), (T); if $|S| \leq 1$ then also (AS)

43

44

Example

3.1.9 Find the properties of the *empty relation* $\emptyset \subset S \times S$ and the *universal relation* $U = S \times S$. Assume that S is a nonempty domain.

- (a) \emptyset is (AR), (S), (AS), (T); if $S = \emptyset$ itself then \emptyset is also (R).
 (b) U is (R), (S), (T); if $|S| \leq 1$ then also (AS)

Example

3.1.10(a) Give examples of relations with specified properties.
 (AS), (T), $\neg(R)$.

Examples over \mathbb{N} , $\text{Pow}(\mathbb{N})$

- strict order of numbers $x < y$
- simple (weak) order, but with some pairs (x, x) removed from \mathcal{R}
- being a prime divisor
 $(p, n) \in \mathcal{R}$ iff p is prime and $p|n$
 - not reflexive: $(1, 1) \notin \mathcal{R}, (4, 4) \notin \mathcal{R}, (6, 6) \notin \mathcal{R}$
 - transitivity is meaningful only for the pairs $(p, p), (p, n), p|n$ for p prime

Example

3.1.10(a) Give examples of relations with specified properties.
 (AS), (T), $\neg(R)$.

Examples over \mathbb{N} , $\text{Pow}(\mathbb{N})$

- strict order of numbers $x < y$
- simple (weak) order, but with some pairs (x, x) removed from \mathcal{R}
- being a prime divisor
 $(p, n) \in \mathcal{R}$ iff p is prime and $p|n$
 - not reflexive: $(1, 1) \notin \mathcal{R}, (4, 4) \notin \mathcal{R}, (6, 6) \notin \mathcal{R}$
 - transitivity is meaningful only for the pairs $(p, p), (p, n), p|n$ for p prime

Example

3.1.10(b) Give examples of relations with specified properties.
 (S), $\neg(R)$, $\neg(T)$.

Easiest examples - inequality

- $\mathcal{R} = \{(x, y) | x \neq y, x, y \in \mathbb{N}\}$
- $\mathcal{R} = \{(A, B) | A \neq B, A, B \subseteq S\}$

Example

3.1.10(b) Give examples of relations with specified properties.

(S), $\neg(R)$, $\neg(T)$.

Easiest examples - inequality

- $\mathcal{R} = \{(x, y) | x \neq y, x, y \in \mathbb{N}\}$
- $\mathcal{R} = \{(A, B) | A \neq B, A, B \subseteq S\}$

49

Navigation icons

Example

3.1.14 Which properties carry from individual relations to their union?

- (a) $\mathcal{R}_1, \mathcal{R}_2 \in (R) \Rightarrow \mathcal{R}_1 \cup \mathcal{R}_2 \in (R)$
- (b) $\mathcal{R}_1, \mathcal{R}_2 \in (S) \Rightarrow \mathcal{R}_1 \cup \mathcal{R}_2 \in (S)$
- (c) $\mathcal{R}_1, \mathcal{R}_2 \in (T) \not\Rightarrow \mathcal{R}_1 \cup \mathcal{R}_2 \in (T)$

Eg. $S = \{a, b, c\}, a\mathcal{R}_1 b, b\mathcal{R}_2 c$
and no other relationships

51

Navigation icons

Equivalence Relations and Partitions

Relation \mathcal{R} is called an *equivalence* relation if it satisfies (R), (S), (T). Every equivalence \mathcal{R} defines *equivalence classes* on its domain S .

The equivalence class $[s]$ (w.r.t. \mathcal{R}) of an element $s \in S$ is

$$[s] = \{ t \in S : t\mathcal{R}s \}$$

This notion is well defined only for \mathcal{R} which is an equivalence relation. Collection of all equivalence classes $[S]_{\mathcal{R}} = \{ [s] : s \in S \}$ is a partition of S

$$S = \bigcup_{s \in S} [s]$$

52

Navigation icons

Thus the equivalence classes are disjoint and jointly cover the entire domain. It means that every element belongs to one (and only one) equivalence class.

We call s_1, s_2, \dots *representatives* of (different) equivalence classes. For $s, t \in S$ either $[s] = [t]$, when $s \mathcal{R} t$, or $[s] \cap [t] = \emptyset$, when $s \not\mathcal{R} t$. We commonly write $s \sim_{\mathcal{R}} t$ when s, t are in the same equivalence class.

In the opposite direction, a partition of a set defines the equivalence relation on that set. If $S = S_1 \dot{\cup} \dots \dot{\cup} S_k$, then we specify $s \sim t$ exactly when s and t belong to the same S_i .

If the relation \sim is an equivalence on S and $[S]$ the corresponding partition, then

$$\nu : S \longrightarrow [S], \quad \nu : s \mapsto [s] = \{ x \in S : x \sim s \}$$

is called the *natural* map. It is always onto.

Question

When is ν also 1-1 ?

53

If the relation \sim is an equivalence on S and $[S]$ the corresponding partition, then

$$\nu : S \longrightarrow [S], \quad \nu : s \mapsto [s] = \{ x \in S : x \sim s \}$$

is called the *natural* map. It is always onto.

Question

When is ν also 1-1 ?

Answer

When \sim is the identity on S .

55

54

A function $f : S \longrightarrow T$ defines an equivalence relation on S by

$$s_1 \sim s_2 \quad \text{iff} \quad f(s_1) = f(s_2)$$

These sets $f^{\leftarrow}(t)$, $t \in T$ that are nonempty form the corresponding partition

$$S = \bigcup_{t \in T} f^{\leftarrow}(t)$$

Question

When are all $f^{\leftarrow}(t) \neq \emptyset$?

56

A function $f : S \rightarrow T$ defines an equivalence relation on S by

$$s_1 \sim s_2 \text{ iff } f(s_1) = f(s_2)$$

These sets $f^{-1}(t)$, $t \in T$ that are nonempty form the corresponding partition

$$S = \bigcup_{t \in T} f^{-1}(t)$$

Question

When are all $f^{-1}(t) \neq \emptyset$?

Answer

When f is onto.

Example

Partition of \mathbb{Z} into classes of numbers with the same remainder $(\text{mod } p)$; it is particularly important for p prime

$$\mathbb{Z}(p) = \mathbb{Z}_p = \{0, 1, \dots, p-1\}$$

One can define all four arithmetic operations (with the usual properties) on \mathbb{Z}_p for a prime p ; division has to be restricted when p is not prime.

Standard notation:

$m = n \pmod{p}$ stands for: $m \text{ mod } p = n \text{ mod } p$

NB

$(\mathbb{Z}_p, +, \cdot, 0, 1)$ are fundamental algebraic structures known as **rings**. These structures are very important in coding theory and cryptography.

Example

3.6.6 (supp) Show that $m \sim n$ iff $m^2 = n^2 \pmod{5}$ is an equivalence on $S = \{1, \dots, 7\}$. Find all the equivalence classes.

(a) It just means that $m = n \pmod{5}$ or $m = -n \pmod{5}$, e.g. $1 = -4 \pmod{5}$. This satisfies (R), (S), (T).

(b) We have

$$[1] = \{1, 4, 6\}$$

$$[2] = \{2, 3, 7\}$$

$$[5] = \{5\}$$

Example

3.6.6 (supp) Show that $m \sim n$ iff $m^2 = n^2 \pmod{5}$ is an equivalence on $S = \{1, \dots, 7\}$. Find all the equivalence classes.

(a) It just means that $m = n \pmod{5}$ or $m = -n \pmod{5}$, e.g. $1 = -4 \pmod{5}$. This satisfies (R), (S), (T).

(b) We have

$$[1] = \{1, 4, 6\}$$

$$[2] = \{2, 3, 7\}$$

$$[5] = \{5\}$$

Supplementary Exercises

3.6.10 (supp)

\mathcal{R} is a binary relation on $\mathbb{N} \times \mathbb{N}$, i.e. it is a subset of \mathbb{N}^4

$(m, n) \mathcal{R} (p, q)$ if $m = p \pmod{3}$ or $n = q \pmod{5}$.

(a) $\mathcal{R} \in (R)$?

Yes: $(m, n) \sim (m, n)$ iff $m = m \pmod{3}$ or $n = n \pmod{5}$ iff true or true.

(b) $\mathcal{R} \in (S)$?

Yes: by symmetry of $. = . \pmod{n}$.

(c) $\mathcal{R} \in (T)$?

No — for arbitrary two pairs (m_1, n_1) and (m_2, n_2) one can create a chain $(m_1, n_1) \mathcal{R} (m_2, n_1)$ and $(m_2, n_1) \mathcal{R} (m_2, n_2)$, but not all pairs are related.

Supplementary Exercises

3.6.10 (supp)

Order Relations

Total order \leq on S

(R) $x \leq x$ for all $x \in S$

(AS) $x \leq y, y \leq x \Rightarrow x = y$

(T) $x \leq y, y \leq z \Rightarrow x \leq z$

(L) *Linearity* — any two elements are comparable:
for all x, y either $x \leq y$ or $y \leq x$ (and both if $x = y$)

On a finite set all total orders are “isomorphic”

$$x_1 \leq x_2 \leq \dots \leq x_n$$

On an infinite set there is quite a variety of possibilities.

Examples

- discrete with a least element, e.g. $\mathbb{N} = \{0, 1, 2, \dots\}$
- discrete without a least element, e.g. $\mathbb{Z} = \{\dots, 0, 1, 2, \dots\}$
- various dense/locally dense orders
 - rational numbers $\mathbb{Q} : \forall p, q \in \mathbb{Q} (p < q \Rightarrow \exists r \in \mathbb{Q} (p < r < q))$
 - $S = [a, b]$ — both least and greatest elements
 - $S = (a, b]$ — no least element
 - $S = [a, b)$ — no greatest element
 - other $[0, 1] \cup [2, 3] \cup [4, 5] \cup \dots$

65

Navigation icons

66

Navigation icons

Partial Order

A **partial order** \preceq on S satisfies (R), (AS), (T); need not be (L)
We call (S, \preceq) a **poset** — partially ordered set

Every finite poset can be represented as a **Hasse diagram**, where
a line is drawn *upward* from x to y if $x \prec y$ and there is no z such
that $x \prec z \prec y$

11.1.1(a) Hasse diagram for positive divisors of 24

$p \preceq q$ if, and only if, $p \mid q$

67

Navigation icons

68

Navigation icons

Ordering Concepts

- *Minimal* and *maximal* elements (they always exist in every finite poset)
- *Minimum* and *maximum* — unique minimal and maximal element
- *lub* (least upper bound) and *glb* (greatest lower bound) of a subset $A \subseteq S$ of elements
 - $\text{lub}(A)$ — smallest element $x \in S$ s.t. $x \succeq a$ for all $a \in A$
 - $\text{glb}(A)$ — greatest element $x \in S$ s.t. $x \preceq a$ for all $a \in A$
- *Lattice* — a poset where lub and glb exist for every pair of elements
(by induction, they then exist for every *finite* subset of elements)

Examples

- $\text{Pow}(\{a, b, c\})$ with the order \subseteq
 \emptyset is minimum; $\{a, b, c\}$ is maximum
- 11.1.4
 $\text{Pow}(\{a, b, c\}) \setminus \{\{a, b, c\}\}$ (proper subsets of $\{a, b, c\}$)
 Each two-element subset $\{a, b\}, \{a, c\}, \{b, c\}$ is maximal.
 - But there is no maximum
- $\{1, 2, 3, 4, 6, 8, 12, 24\}$ partially ordered by divisibility is a lattice
 - e.g. $\text{lub}(\{4, 6\}) = 12$; $\text{glb}(\{4, 6\}) = 2$
- $\{1, 2, 3\}$ partially ordered by divisibility is not a lattice
 - $\{2, 3\}$ has no lub
- $\{2, 3, 6\}$ partially ordered by divisibility is not a lattice
 - $\{2, 3\}$ has no glb

Examples

- $\{1, 2, 3, 12, 18, 36\}$ partially ordered by divisibility is not a lattice
 - $\{2, 3\}$ has no lub ($12, 18$ are minimal upper bounds)

???

Example

NR

*An infinite lattice need not have a lub (or no glb) for an arbitrary infinite subset of its elements, in particular no such bound may exist for **all** its elements.*

Examples

- \mathbb{Z} — neither lub nor glb;
- $\mathbb{F}(\mathbb{N})$ — all finite subsets, has no *arbitrary* lub property; glb exists, it is the intersection, hence always finite;
- $\mathbb{I}(\mathbb{N})$ — all infinite subsets, may not have an arbitrary glb; lub exists, it is the union, which is always infinite.

11.1.5 Consider poset (\mathbb{R}, \leq)

- Is this a lattice?
- Give an example of a non-empty subset of \mathbb{R} that has no upper bound.
- Find $\text{lub}(\{x \in \mathbb{R} : x < 73\})$
- Find $\text{lub}(\{x \in \mathbb{R} : x \leq 73\})$
- Find $\text{lub}(\{x : x^2 < 73\})$
- Find $\text{glb}(\{x : x^2 < 73\})$

Example

11.1.5 Consider poset (\mathbb{R}, \leq)

- (a) It is a lattice.
- (b) subset with no upper bound: $\mathbb{R}_{>0} = \{ r \in \mathbb{R} : r > 0 \}$
- (c) and (d) $\text{lub}(\{ x : x < 73 \}) = \text{lub}(\{ x : x \leq 73 \}) = 73$
- (e) $\text{lub}(\{ x : x^2 < 73 \}) = \sqrt{73}$
- (f) $\text{glb}(\{ x : x^2 < 73 \}) = -\sqrt{73}$

Example

11.1.13 $\mathbb{F}(\mathbb{N})$ — collection of all *finite* subsets of \mathbb{N}

- (a) Does it have a maximal element?
- (b) Does it have a minimal element?
- (c) Given $A, B \in \mathbb{F}(\mathbb{N})$, does $\{A, B\}$ have a lub in $\mathbb{F}(\mathbb{N})$?
- (d) Given $A, B \in \mathbb{F}(\mathbb{N})$, does $\{A, B\}$ have a glb in $\mathbb{F}(\mathbb{N})$?
- (e) Is $\mathbb{F}(\mathbb{N})$ a lattice?

73

74

Example

11.1.13 $\mathbb{F}(\mathbb{N})$ — collection of all *finite* subsets of \mathbb{N}

- (a) No maximal elements
- (b) \emptyset is the minimum
- (c) $\text{lub}(A, B) = A \cup B$
- (d) $\text{glb}(A, B) = A \cap B$
- (e) $\mathbb{F}(\mathbb{N})$ is a lattice — is has *finite* union and intersection properties.

Example

11.1.14 $\mathbb{I}(\mathbb{N}) = \text{Pow}(\mathbb{N}) \setminus \mathbb{F}(\mathbb{N})$ — collection of all *infinite* subsets of \mathbb{N}

- (a) Does it have a maximal element?
- (b) Does it have a minimal element?
- (c) Given $A, B \in \mathbb{I}(\mathbb{N})$, does $\{A, B\}$ have a lub in $\mathbb{I}(\mathbb{N})$?
- (d) Given $A, B \in \mathbb{I}(\mathbb{N})$, does $\{A, B\}$ have a glb in $\mathbb{I}(\mathbb{N})$?
- (e) Is $\mathbb{I}(\mathbb{N})$ a lattice?

75

76

Example

11.1.14 $\mathbb{I}(\mathbb{N}) = \text{Pow}(\mathbb{N}) \setminus \mathbb{F}(\mathbb{N})$ — collection of all *infinite* subsets of \mathbb{N}

- (a) \mathbb{N} is the maximum
- (b) No minimal elements (\emptyset is not in $\mathbb{I}(\mathbb{N})$)
- (c) $\text{lub}(A, B) = A \cup B$
- (d) $\text{glb}(A, B) = A \cap B$ if it exists; it does not exist when $A \cap B$ is finite, eg. when empty.
- (e) $\mathbb{I}(\mathbb{N})$ is not a lattice — it has finite union but not finite intersection property; eg. sets $2\mathbb{N}$ and $2\mathbb{N} + 1$ have the empty intersection.

Well-Ordered Sets

Well-ordered set: every subset has a least element.

NB

The greatest element is not required.

Examples

- $\mathbb{N} = \{0, 1, \dots\}$
- $\mathbb{N}_1 \dot{\cup} \mathbb{N}_2 \dot{\cup} \mathbb{N}_3 \dot{\cup} \dots$, where each $\mathbb{N}_i \simeq \mathbb{N}$ and $\mathbb{N}_1 < \mathbb{N}_2 < \mathbb{N}_3 \dots$

NB

Well-order sets are an important mathematical tool to prove termination of programs.

77

Navigation icons

78

Ordering of a Poset — Topological Sort

拓扑顺序

For a poset (S, \preceq) any linear order \leq that is consistent with \preceq is called **topological sort**. Consistency means that $a \preceq b \Rightarrow a \leq b$.

Example

The following all are topological sorts:

$$a \leq b \leq e \leq c \leq f \leq d$$

$$a \leq e \leq b \leq f \leq c \leq d$$

.....

$$a \leq e \leq f \leq b \leq c \leq d$$

79

Navigation icons

80

Combining Orders

Product order — can combine any partial orders. In general, it is only a *partial order*, even if combining total orders.

For $s, s' \in S$ and $t, t' \in T$ define

$$(s, t) \preceq (s', t') \quad \text{if } s \preceq s' \text{ and } t \preceq t'$$

Navigation icons

Practical Orderings

They are, effectively, *total* orders on the *product* of ordered sets.

- **Lexicographic order** — defined on all of Σ^* . It extends a total order already assumed to exist on Σ .
- **Lenlex** — the order on (potentially) the entire Σ^* , where the elements are ordered first by length.
 $\Sigma^{(1)} \prec \Sigma^{(2)} \prec \Sigma^{(3)} \prec \dots$, then lexicographically within each $\Sigma^{(k)}$. In practice it is applied only to the finite subsets of Σ^* .
- **Filing order** — lexicographic order confined to the strings of the same length.
 It defines total orders on Σ^i , separately for each i .

Example

11.2.5 Let $\mathbb{B} = \{0, 1\}$ with the usual order $0 < 1$. List the elements 101, 010, 11, 000, 10, 0010, 1000 of \mathbb{B}^* in the

(a) Lexicographic order

000, 0010, 010, 10, 1000, 101, 11

(b) Lenlex order

10, 11, 000, 010, 101, 0010, 1000

11.2.8 When are the lexicographic order and *lenlex* on Σ^* the same?

Only when $|\Sigma| = 1$.

81

82

Example

0 come before 1

11.2.5 Let $\mathbb{B} = \{0, 1\}$ with the usual order $0 < 1$. List the elements 101, 010, 11, 000, 10, 0010, 1000 of \mathbb{B}^* in the

(a) Lexicographic order

000, 0010, 010, 10, 1000, 101, 11

(b) Lenlex order

10, 11, 000, 010, 101, 0010, 1000

字典顺序

长度顺序

先按长度顺序, 再按大小

先看第一位 0 的往前, 1 的往后, 再看第二位, 0 的往前, 1 的往后, 以此类推

11.2.8 When are the lexicographic order and *lenlex* on Σ^* the same?

Only when $|\Sigma| = 1$.

Supplementary Exercises

11.6.6 True or false?

- If a set Σ is totally ordered, then the corresponding lexicographic partial order on Σ^* also must be totally ordered.
- If a set Σ is totally ordered, then the corresponding lenlex order on Σ^* also must be totally ordered.
- Every finite partially ordered set has a Hasse diagram.
- Every finite partially ordered set has a topological sorting.
- Every finite partially ordered set has a smallest element.
- Every finite totally ordered set has a largest element.
- An infinite partially ordered set cannot have a largest element.

83

84

11.6.6

- (a) and (b) – True; this is the idea behind various lex-sorts
- (c) Yes.
- (d) Yes.
- (e) False – consider a two-element set with the identity as p.o.
- (f) True – due to the finiteness
- (g) False, eg. $\mathbb{Z}_{<0}$

- Properties of functions: onto, 1-1; f^{-1} , f^{\leftarrow}
- Properties of binary relations: (R), (AR); (S), (AS); (T)
- Matrix operations: transposition, sum, scalar product, product
- Equivalence relations \sim , equivalence classes $[S]$, example \mathbb{Z}_p
- Ordering concepts: total, partial, lub, glb, lattice, topological sort
- Orderings: product, lexicographic, lenlex, filing
